# Digi-Star: GT460; Unverferth 510, 512 & some 520 models

Verifying Firmware Version

Procedure:

1. Start with the scale powered on and showing the live weight
2. Enter **198** using the numeric keypad and press to view the firmware version of the scale

   NOTE: if you get an error message after entering the above command that it is an invalid entry and you are testing an Unverferth 520, use the instructions for the Digi-Star 460 instead and record the information on that page. If you are testing any other model and get the error, record "invalid entry" in the table below

3. The firmware version will be something like: `EZ2 7.D` or **512 8.P** (basically EZ2 and then number.letter or 512 and then number.letter)

For each scale you have of this model, please record the firmware and the serial number on the back of the scale:

Serial Number	Firmware	Broadcast or Autolog

Note: If an Unverferth 520 has "Autolog" printed on the faceplate, it is probably a Digi-Star 460 based scale. If the Unverferth 520 has a port on the front side of it for connecting a moisture sensor it is a Digi-Star 560 based scale.
